

Data Science and Management Project

General Rules:

- You have to create a GitHub repository where to upload your code. Each participant of the group should commit his/her own changes. There should be commit from all the members of the team
- You have to write a 4 (min)- 8(max) pages document in English with the following structure:
 - Introduction to the problem
 - Description of the state of the art (i.e., are there others' works addressing this or a similar problem? What is different this time?)
 - Proposed approach (What procedure have you used? Why?)
 - Results (Plots and tables)
- The document has to be sent at least 3 days before the exam
- You have to create slides for a 5-10 minutes presentation of your work
- The exam will start with a discussion of the project then we will ask general questions on the course subjects.

Project:

Consider this dataset `crime.zip`. It records criminal activities in an American city. For each crime is recorded the type of crime (see also the `offense_code.zip` file) and date and location of the crime.

1. Create a suitable Database / Datawarehouse to store the data
2. Create and analyze a forecasting model to predict where and when crime will happen in the city.

Please note that the project description can be rather under-specified. Your task is also to better specify it and discuss your choices in the report.
